

## S2OSB Headquarters & Conference Hall Hendek, Turkey

**This bold piece of Turkish architecture features a textured metallic envelope, along with perforated panels that filter daylight into the offices.**

Located in Hendek, Turkey, S2OSB, a project by BINAA, is a pioneering management building, headquarters, and conference hall.

The metallic facade wraps the building and helps communicate the structure's multifaceted purpose. The geometrically textured shell begins near the conference hall, mostly with solid panels. These are followed by perforated panels, increasing rhythmically until they detach and form a double facade that filters daylight into the offices.

The interior is camouflaged by the exterior. Daylight continuously changes the look of the anodized, metallic exterior surfaces. At night, the lighting design acts for dual purposes. On the solid facades, the lighting is integrated into partially perforated panels, which become fully perforated near the offices. There, the internal lighting creates an alternative perception of the facades' patterns.
